The Regulation of the EU Parliament and the Council (EU) 2016/425 on Personal Protection Equipment and the European Standard EN 420:2003

The gloves must be stored properly, i.e. in dry conditions and out of direct sunlight. Influences such as humidity, temperatures, sunlight and material changes over a period of time can cause modifications in properties. It is assumed that the efficiency is evaluated in relation to minor risks and that the effect hereof, as they occur, are observed in time and without danger for the user. The degree of protection is determined by the requirements, which can be of mechanical or chemical nature, depending of temperature or similar influences and not demanding a protection degree as in Category II or Category III. In advance, a risk analysis must be carried out. Through a test by wearing the gloves it is determined, which size fits.

To this date, we have no knowledge of substances, in connection with this product that could affect the health of the user. Skin irritations among individuals with very sensitive skin requires a separate analysis with special advice. For further information and instructions, please contact your local department.

When using accessories, such as inner gloves, you should be aware that it could affect the function negatively.

The PPE is classed as Category I, which includes following minimal risks:

Superficial mechanical damage

Contact with non-active detergents or prolonged contact with water

Contact with hot surfaces, which do not exceed 50 C

Non-extreme weather conditions

The degradation time cannot be specified, as it depends on the degree of abrasion and the specific working task.

The item is delivered in uniform sales packaging out of cardboard which is reusable.
